

Imperfect length, imperfect counts

$$A_1 - u_1, \phi_1, \dots, 1, 1, \dots, 1, 1$$

A u A u

need both given first + no back u / first

$$(A_1, u_1), (A_1, u_2)$$

per RNASeq

$$m_1 \rightarrow \Sigma 16$$

$$n_0 = n_1 > 1$$

$$M_n = M_{n-1} + \sum_{k=2}^n M_{k-2} \cdot M_{n-k}$$

 $k_1 \quad k_2$

Thread Safety

k_n - k_5 what's into k_{n+5} .

$$CA \rightarrow I$$

not for

$$u \rightarrow 2$$

0,1

CN u A n A C

$$2 + 2 + 2$$

6

Why did this take a while?

- Skipping the first element being "complete"
- drawing images tedious
- Base in how I split the code.

Pictorially, this is easy to see

If A_1 is chosen as our
Split. "~~left~~"

+ this was my bug
left = Seq[1 ... m]
right = Seq[m+1 ...]
